

Cup-wall trajectories · neural processing 512 × 288 versus 320 × 192

Both 1920 × 1080 output · bounded model input · same fixed, unaligned ROI · all 30 samples per capture

— Original ··· Identity — Enhanced

Linear BT.2020 $Y = 0.2627R + 0.6780G + 0.0593B$. Identity overlaps original at this scale.
All 30 timestamps per capture retained; shared axes by column. Shaded bands mark the largest E—O pair.

New E—O maximum and RMS adjacent changes are smaller; mean E—O is larger. No perceptual acceptance or physical HDR claim.
Source/output and new processing are 16:9; baseline processing is 5:3. Processing size and aspect ratio both differ.
Same source/model/runtime and other settings. No motion compensation or geometry-only causal quality claim.
